Phenotypic data

Phenotypic data

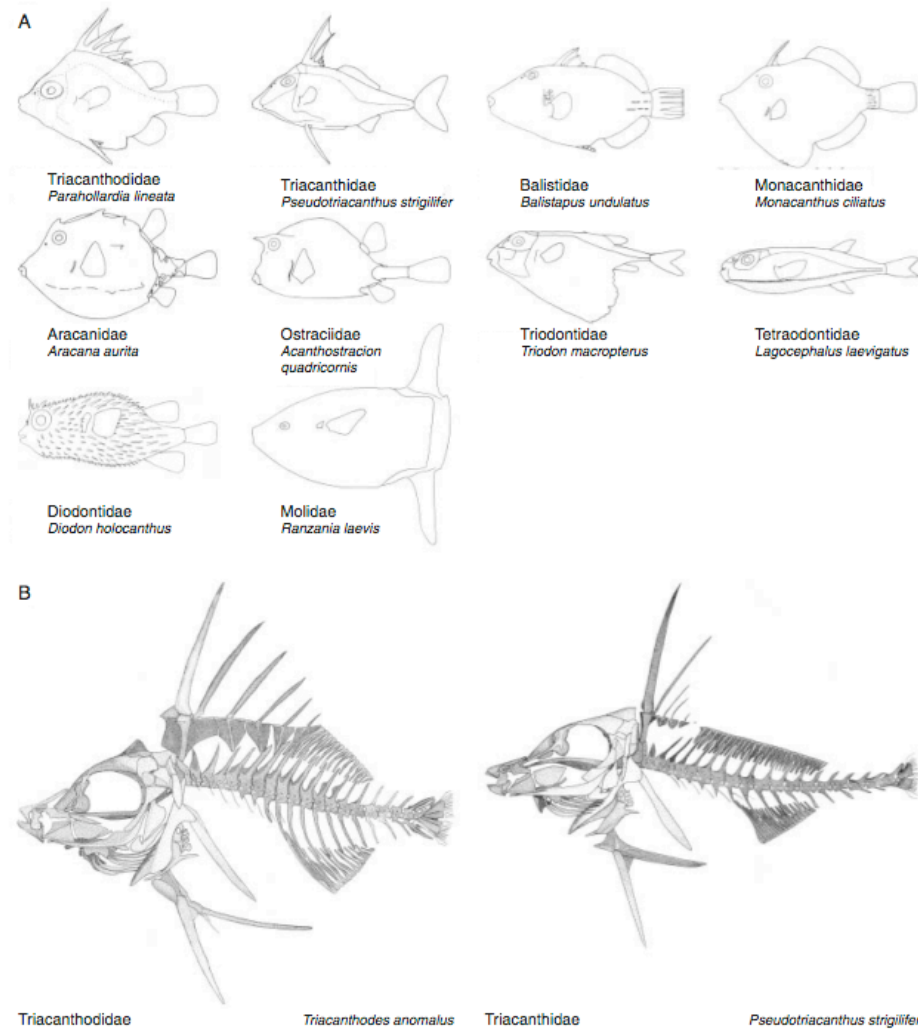

Figure 1. Illustrations of the skeletal anatomy and body shape of a generalized representative for each of the ten extant tetraodontiform families. Lateral views of (A) ten species, one from each extant family, and (B–F) of the skeletons of a representative species for each family, as follows: (B) triacanthodid *Triacanthodes anomalus* and triacanthid *Pseudotriacanthus strigilifer*; (C) balistid *Balistapus undulatus* and monacanthid *Monacanthus ciliatus*; (D) aracanid *Kentrocapros aculeatus* and ostraciid *Acanthostracion quadricornis*; (E) triodontid *Triodon macropterus* and tetraodontid *Lagocephalus laevigatus*; (F) diodontid *Diodon holocanthus* and molid *Ranzania laevis*.

Phenotypic data

566 F. SANTINI and J. C. TYLER

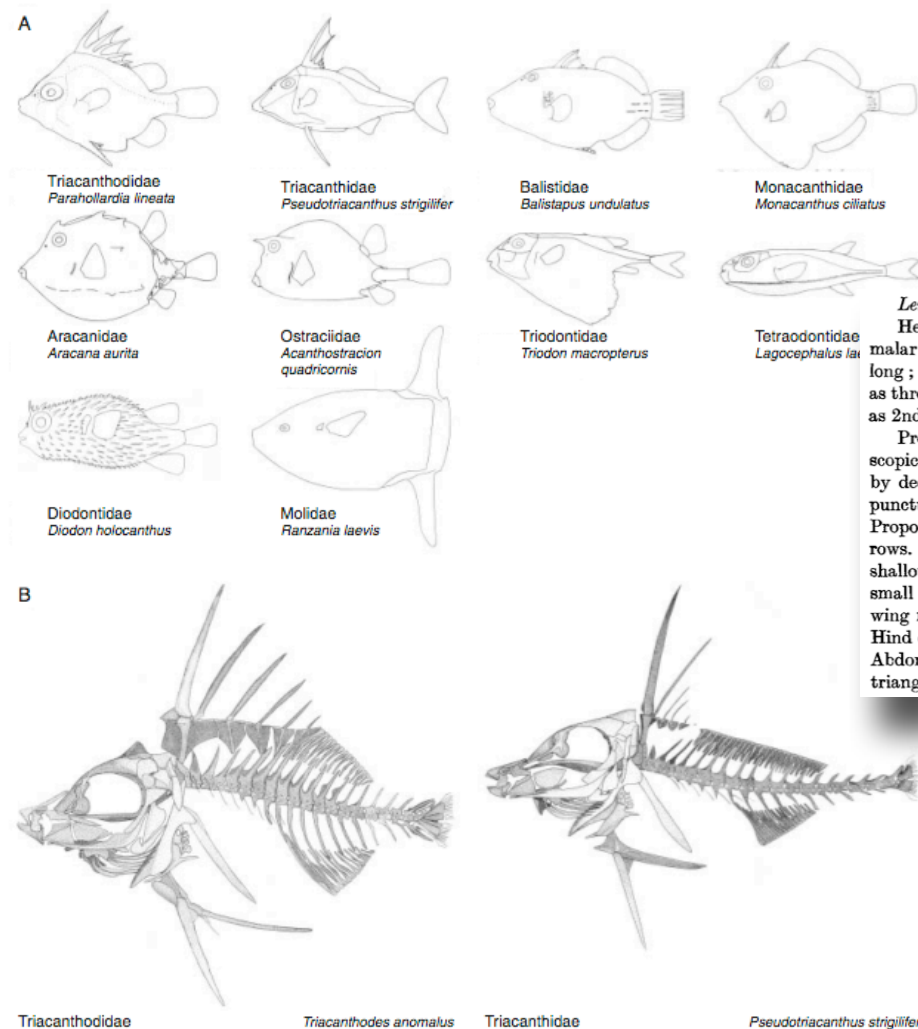

Figure 1. Illustrations of the skeletal anatomy and body shape of a generalized representative for each of the ten extant tetraodontiform families. Lateral views of (A) ten species, one from each extant family, and (B–F) of the skeletons of a representative species for each family, as follows: (B) triacanthodid *Triacanthodes anomalus* and triacanthid *Pseudotriacanthus strigilifer*; (C) balistid *Balistapus undulatus* and monacanthid *Monacanthus ciliatus*; (D) aracanid *Kentrocapros aculeatus* and ostraciid *Acanthostracion quadricornis*; (E) triodontid *Triodon macropterus* and tetraodontid *Lagocephalus laevis*; (F) diodontid *Diodon holocanthus* and molid *Ranzania laevis*.

Length.—8 mm. Entirely black.

Head shining, microscopically finely punctured, without furrows below antennae; malar area large, equal to half the length of eye; mandible with two teeth. Scape very long; in male a little longer than two following segments together, in female nearly as long as three following together; 3rd segment four times as long as 2nd, 4th three times as long as 2nd, in male; 3rd three times and 4th twice as long as 2nd in female.

Prothorax very short; mesonotum shining, almost smooth, except for diffuse microscopic puncturation and one or two larger punctures; prescutum separated from scutum by deep lateral grooves; parapsidal furrows distinct; scutellum with scattered shallow punctures; mesopleura almost smooth; metapleura strongly and closely punctured. Propodeum with large shallow reticulate punctures with a tendency to lie in transverse rows. Boundary of propodeum with metapleuron marked by a regular horizontal row of shallow dorsoventrally elongated depressions. Fore wings with one recurrent nervure, one small closed submarginal cell, very large 1st discoidal cell, and 3rd discoidal cell open to wing margin; each wing with large pointed anal lobe; hind wings each with 10 hamuli. Hind coxae with a few scattered punctures, and hind legs nearly twice as long as the body. Abdomen shining, “club” sometimes reddish ventrally, strongly compressed laterally, triangular or almost ovate. Ovipositor not exerted.

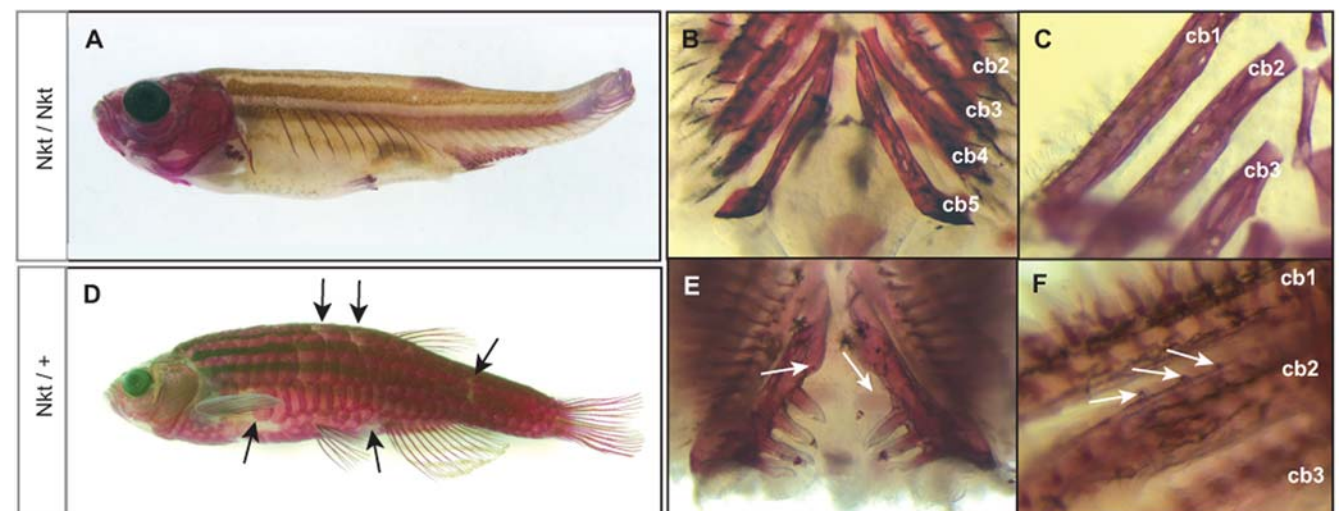

Figure 2. The dominant gene *Nkt* is phenotypically similar, however complements *fls* mutants. *Nkt* homozygotes show complete loss of scales, teeth and gill rakers resembling the *fls* phenotype (A–C). Heterozygous *Nkt* zebrafish show an intermediate phenotype of scale loss and patterning defect (arrows) while no effect on fin development is seen (D). Heterozygous *Nkt* also show a dominant effect on the number of teeth (arrows, E) and gill rakers (F), showing deficiencies along the posterior branchial arches and formation of rudimentary rakers along ceratobranchial 1 and 2 (arrows, F). *Cb1–5*, ceratobranchial bones.

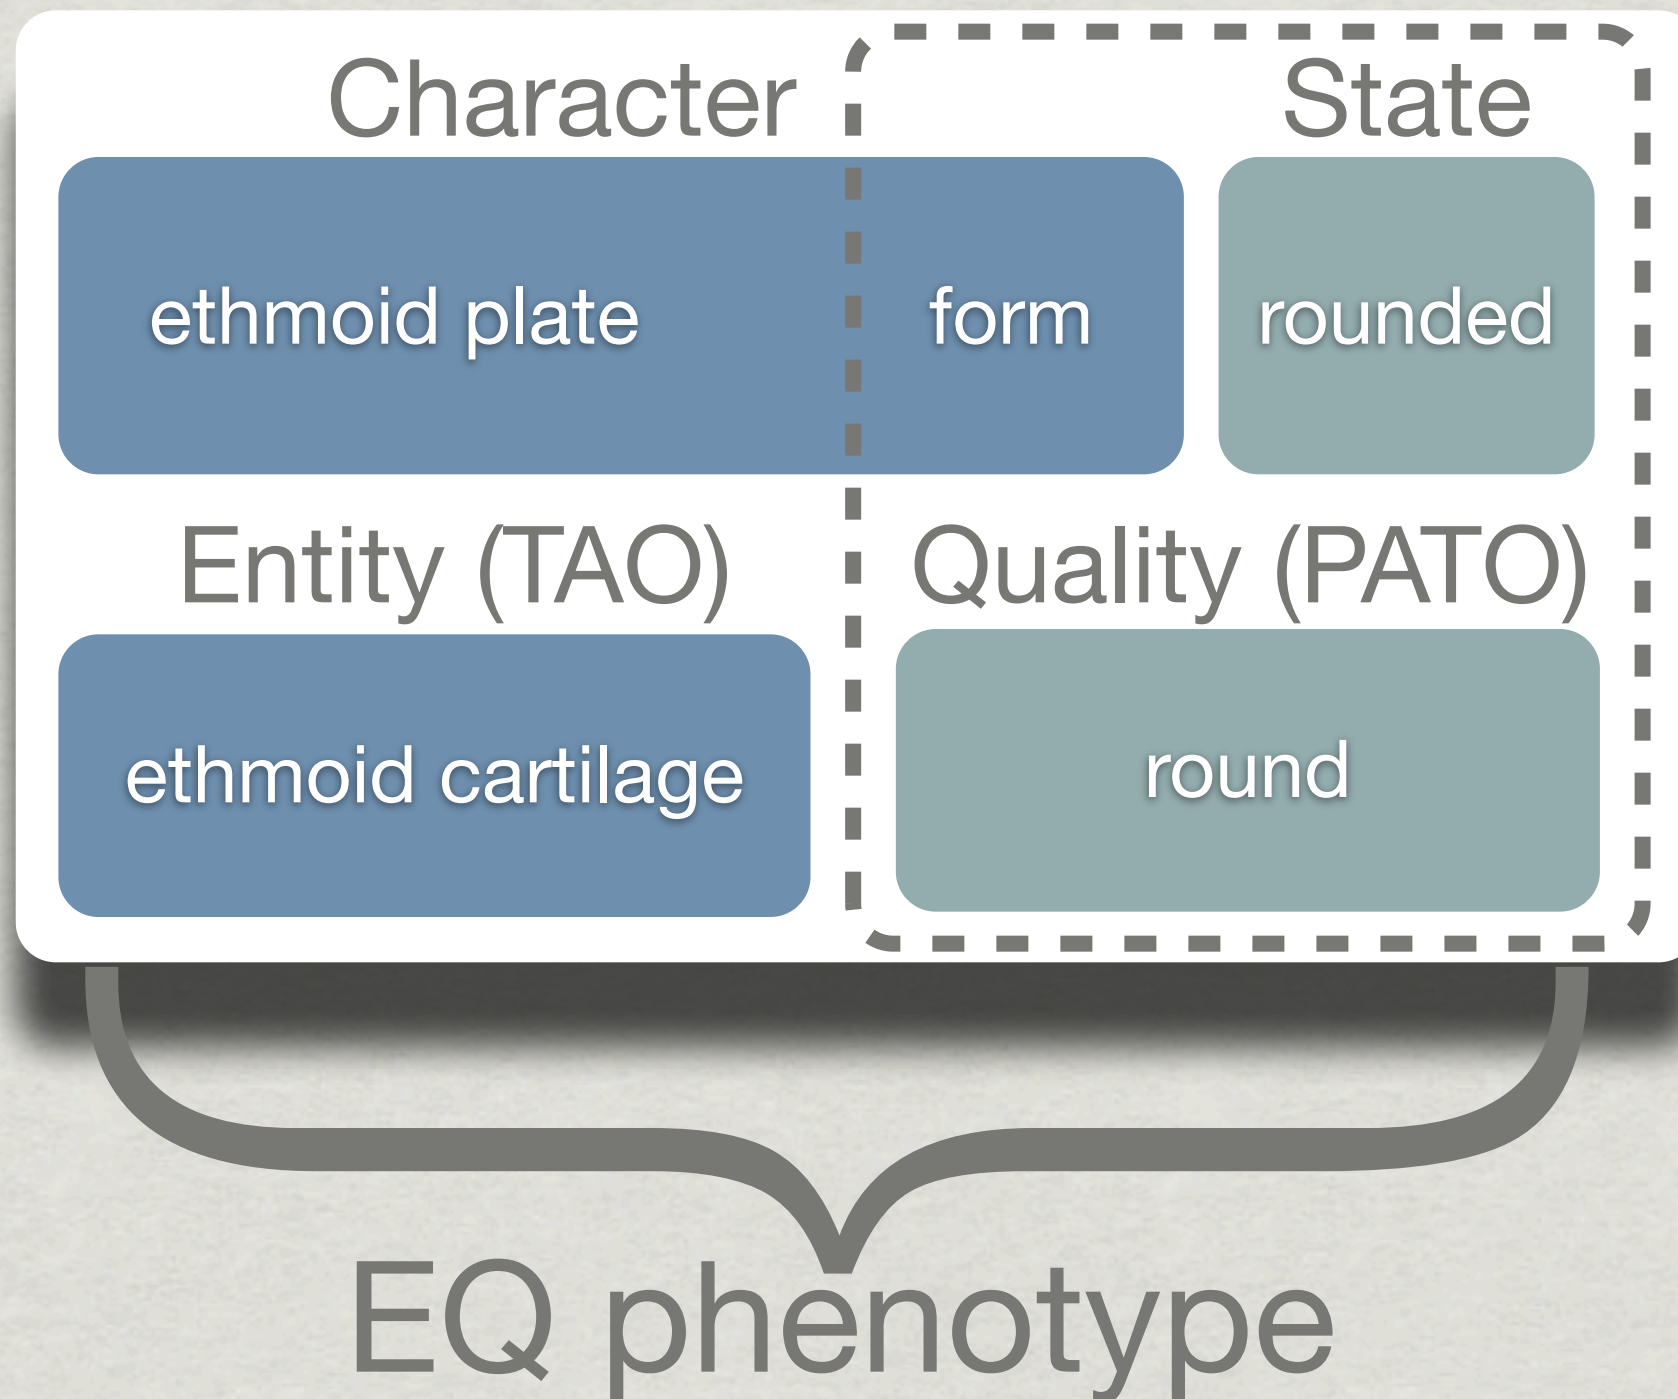

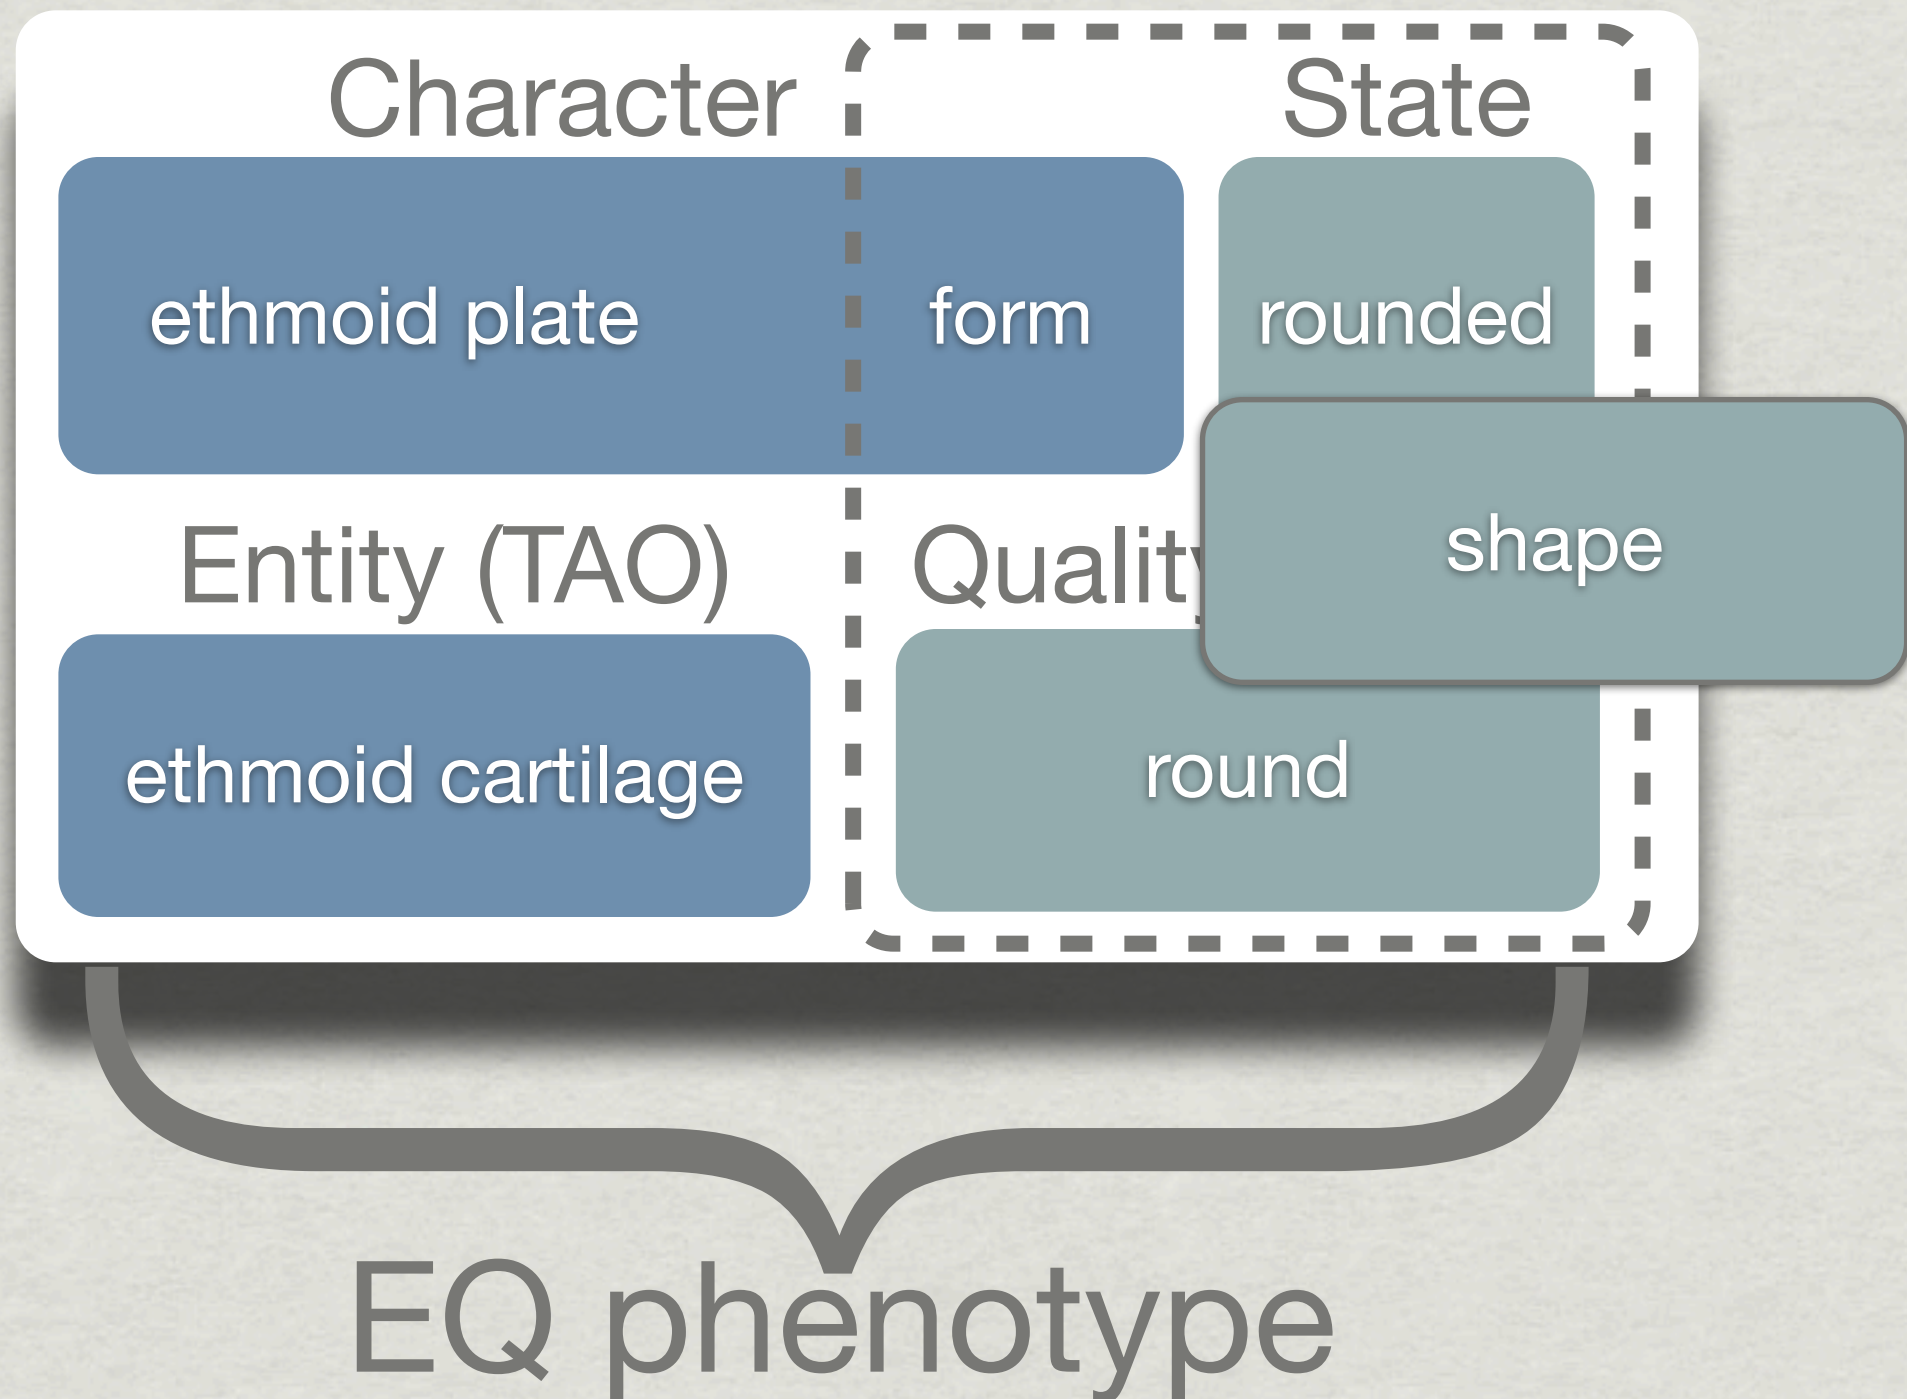

Fig. 7. Dentition of premaxilla and palate in ventral view of (A) *Brachyplatystoma filamentosum*, DU F1052; (B) *Brachyplatystoma capapretum*, MZUSP 53262. Scale bars = 1 cm. PT = pterygoid tooth plate, EN = endopterygoid, VT = vomerine teeth.

7. Ethmoid plate form: rounded [0]; quadrangular [1] (Lundberg et al., 1991b). Within Pimelodidae a uniquely derived and unreversed synapomorphy of *Pimelodus* group plus *Calophysus* group.

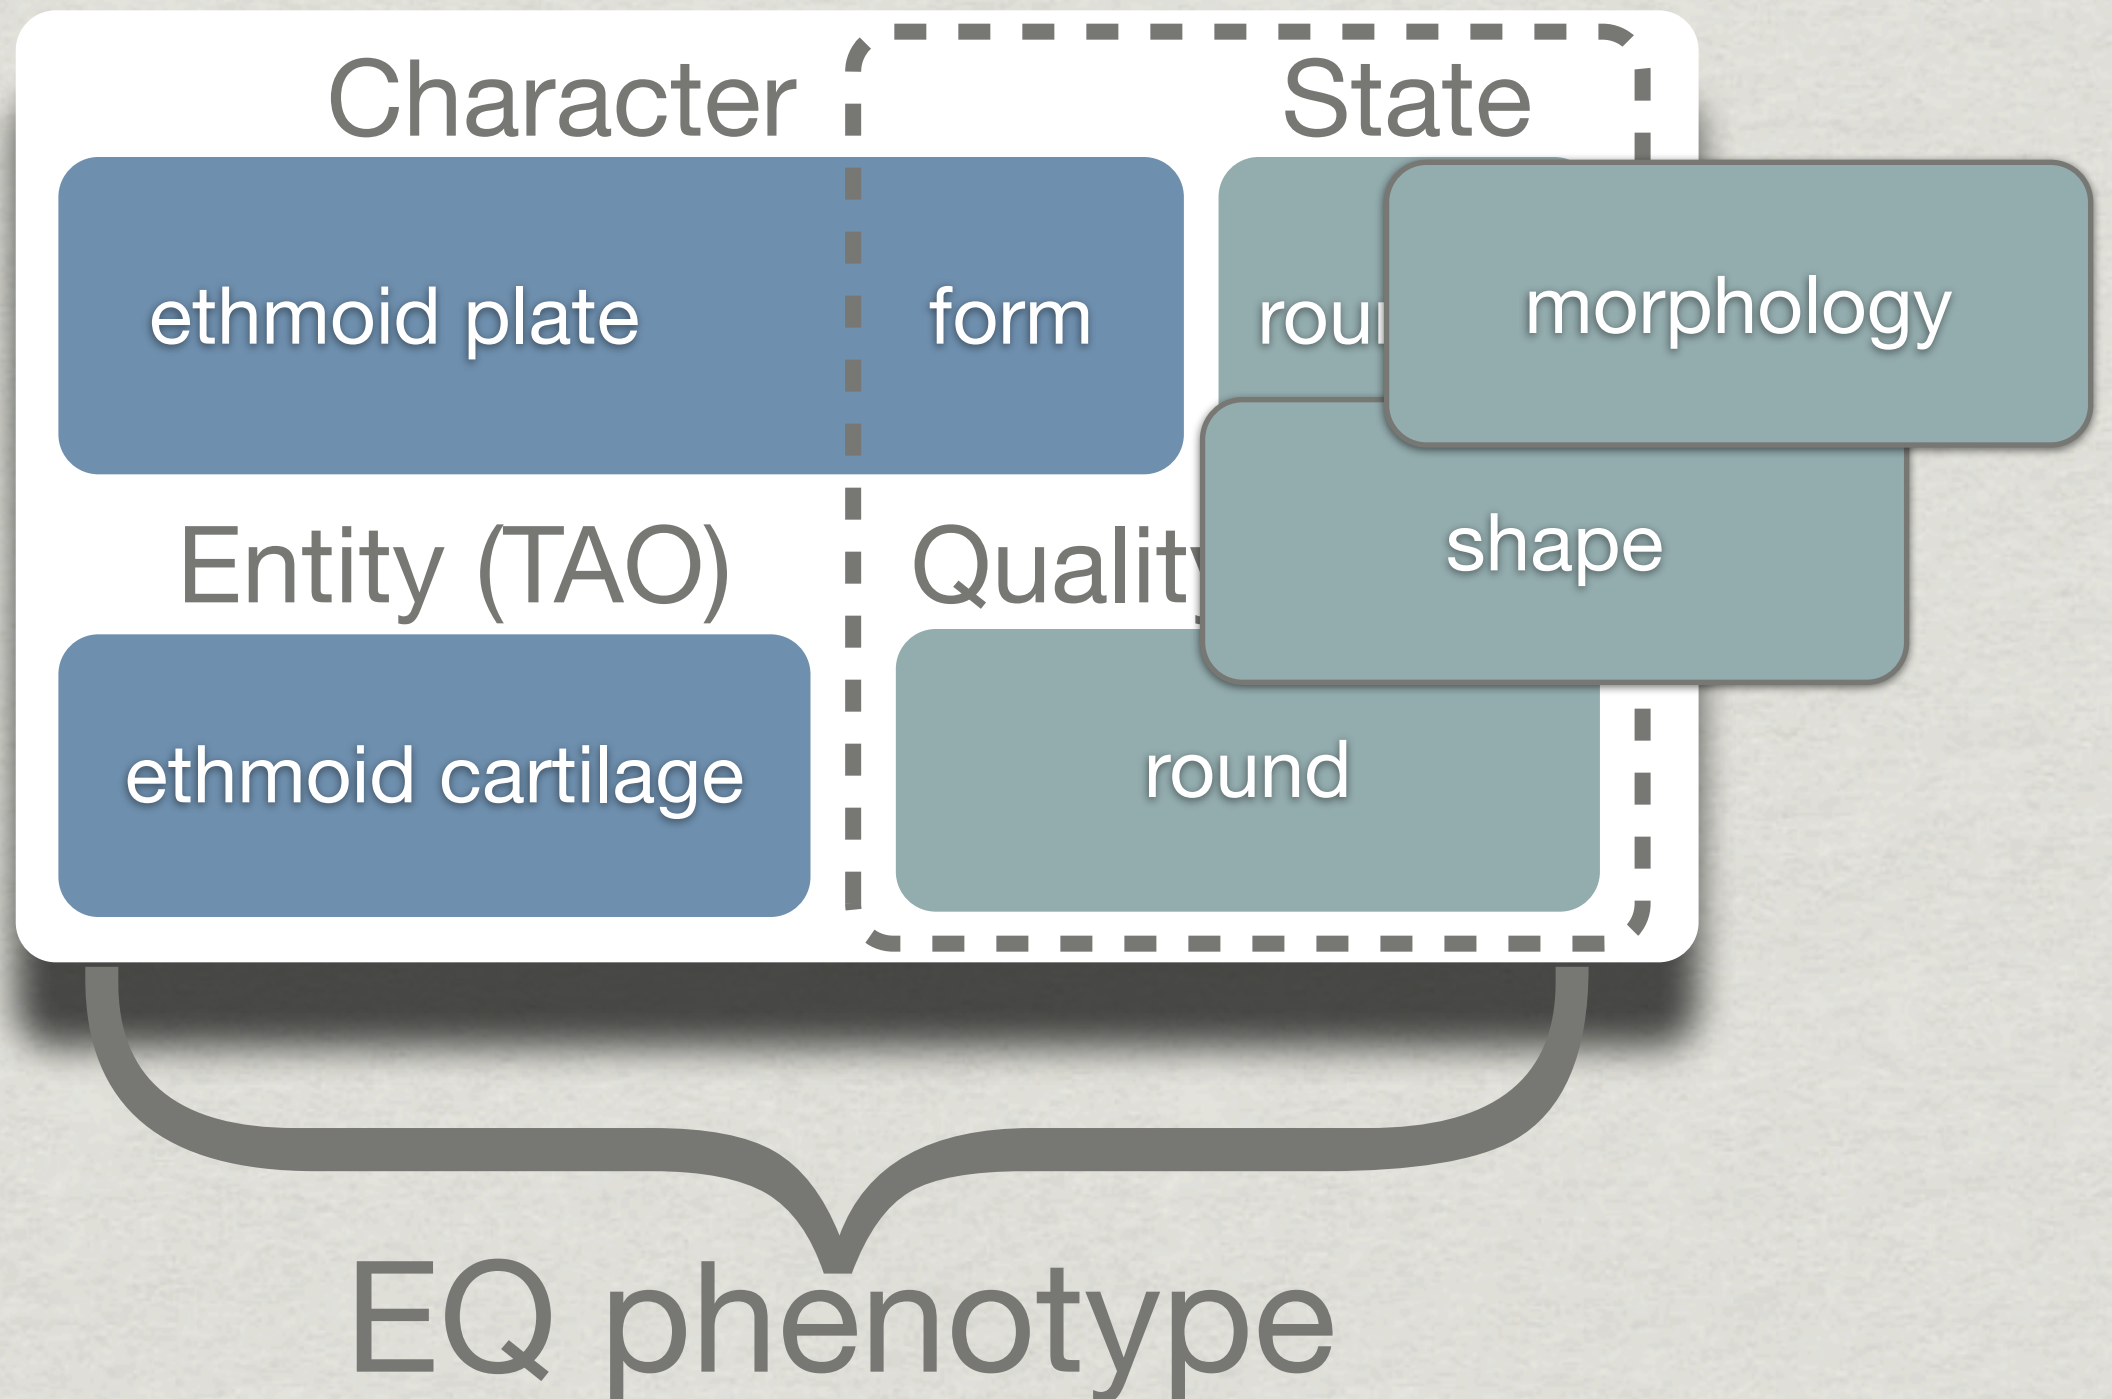

Entity-Quality Model for Evolutionary Phenotypes

Entity-Quality Model for Evolutionary Phenotypes

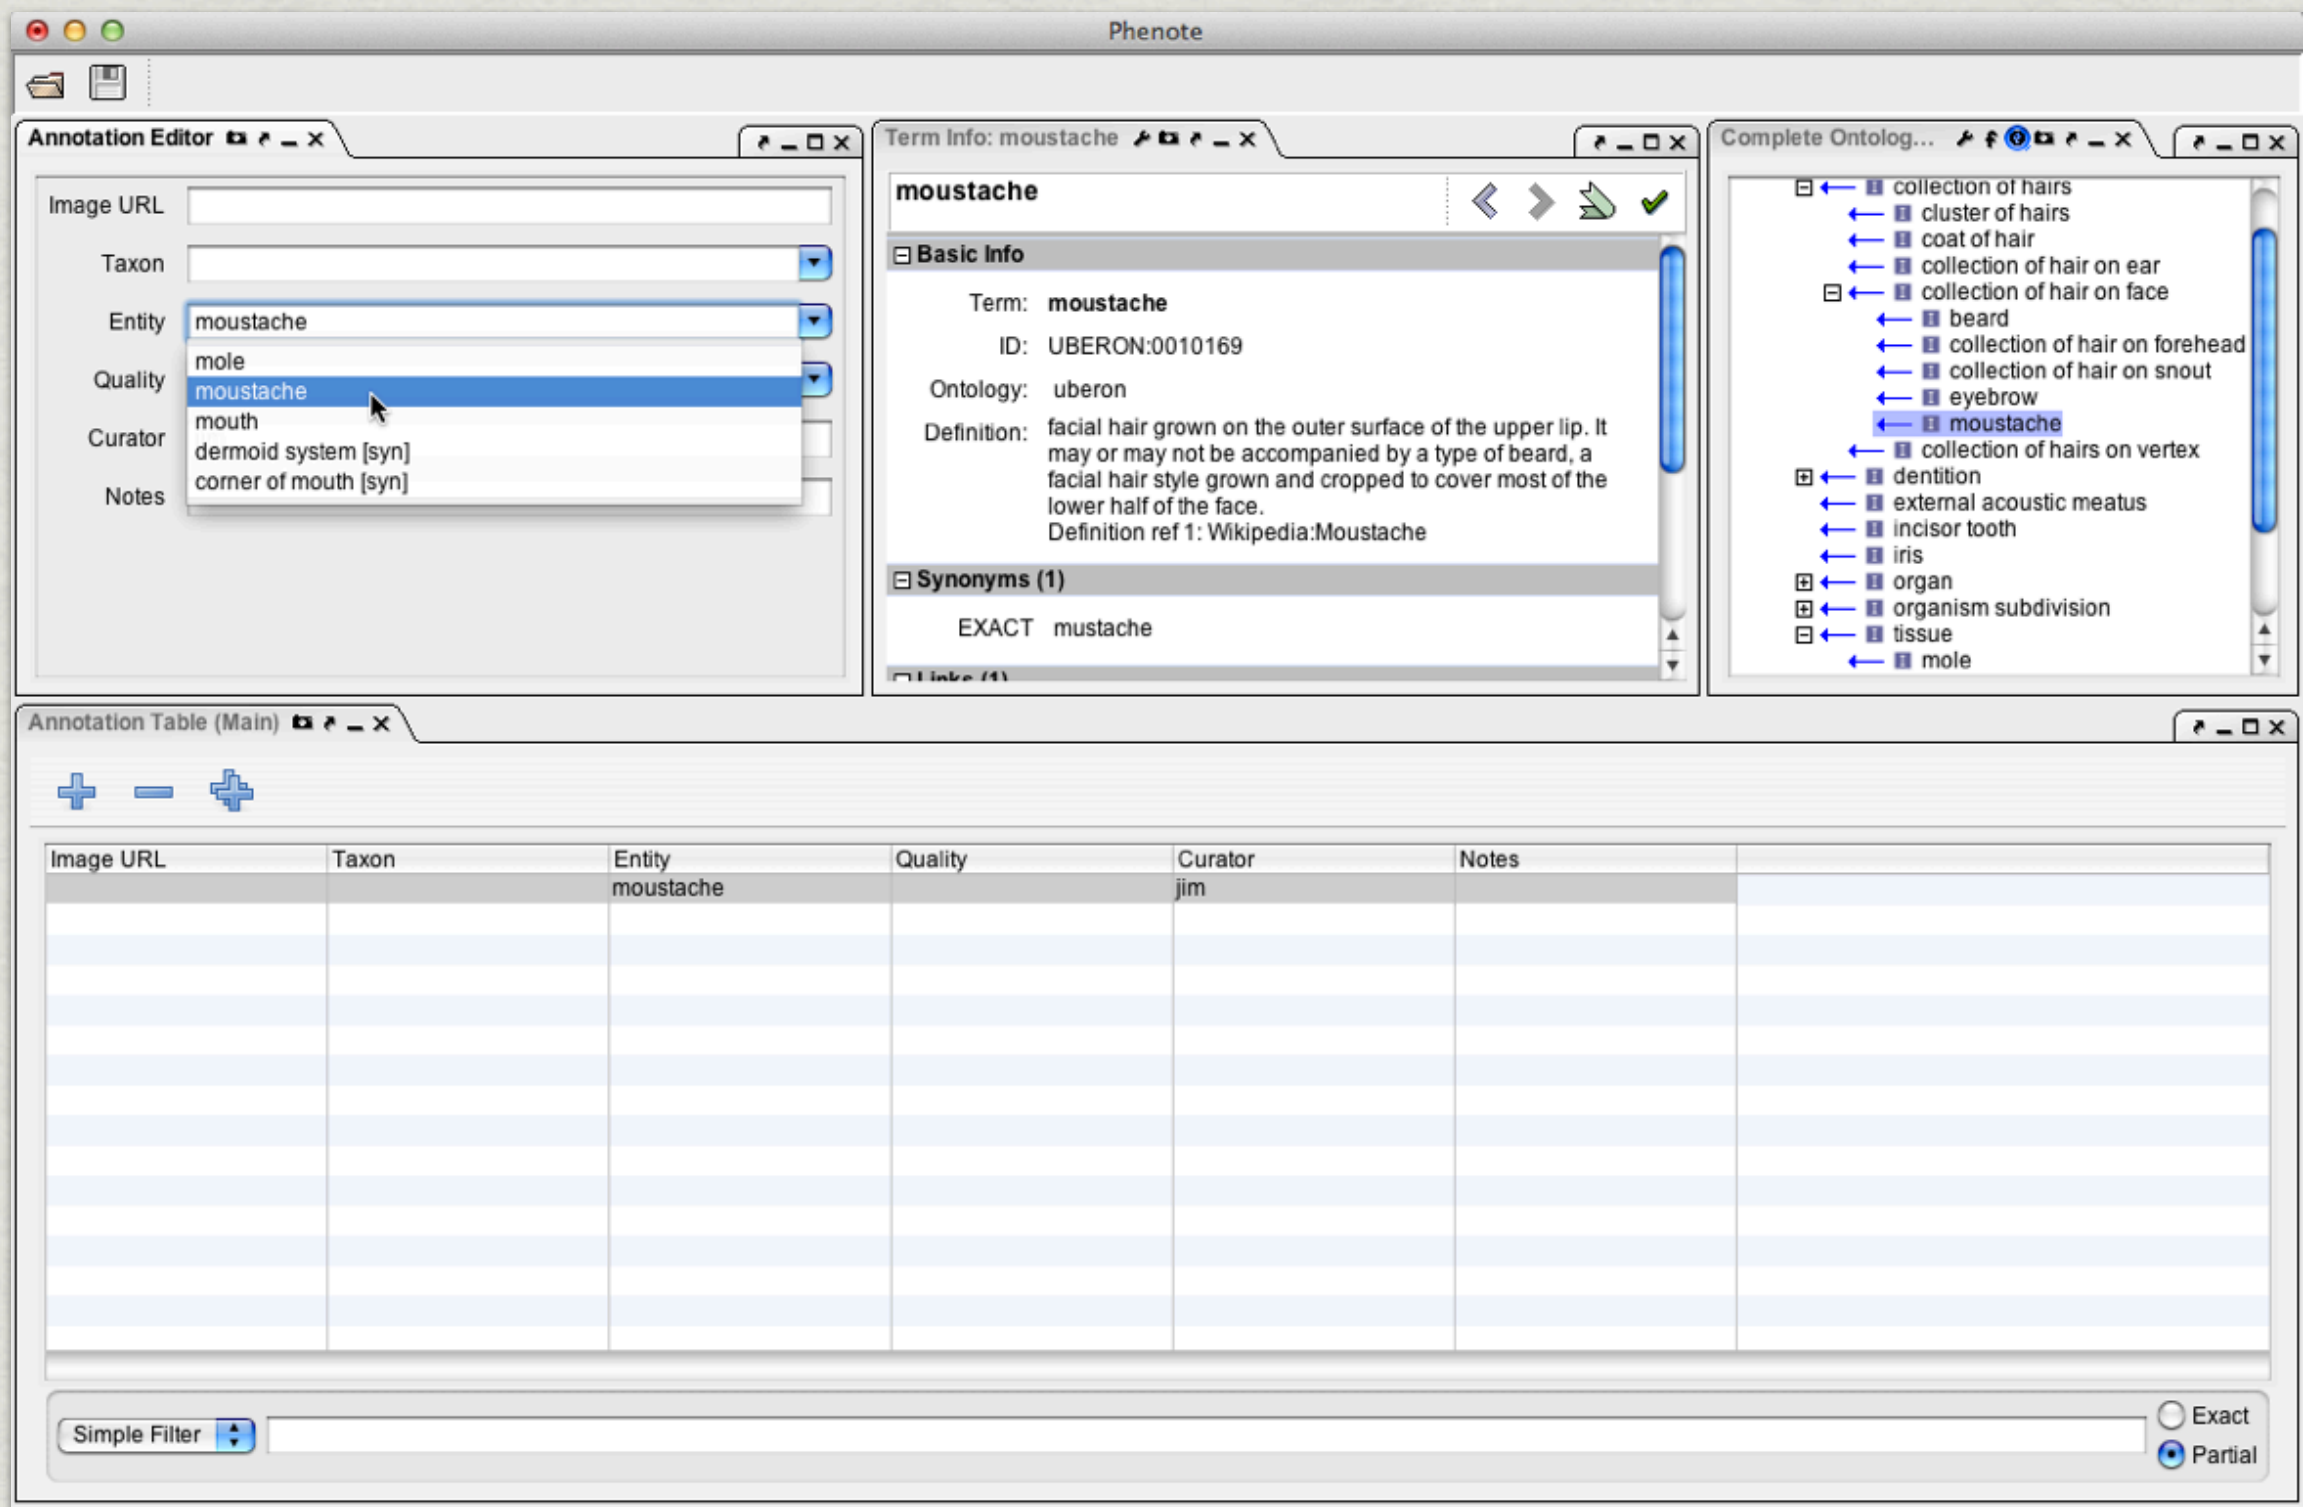

Entity-Quality Model for Evolutionary Phenotypes

Creating annotations

- * **Phenote** — generic, configurable table editor
 - * loads ontologies, provides term autocomplete
- * **Phenex** — specialized for character matrix annotation
- * Custom web interfaces
- * **Protégé** OWL editor

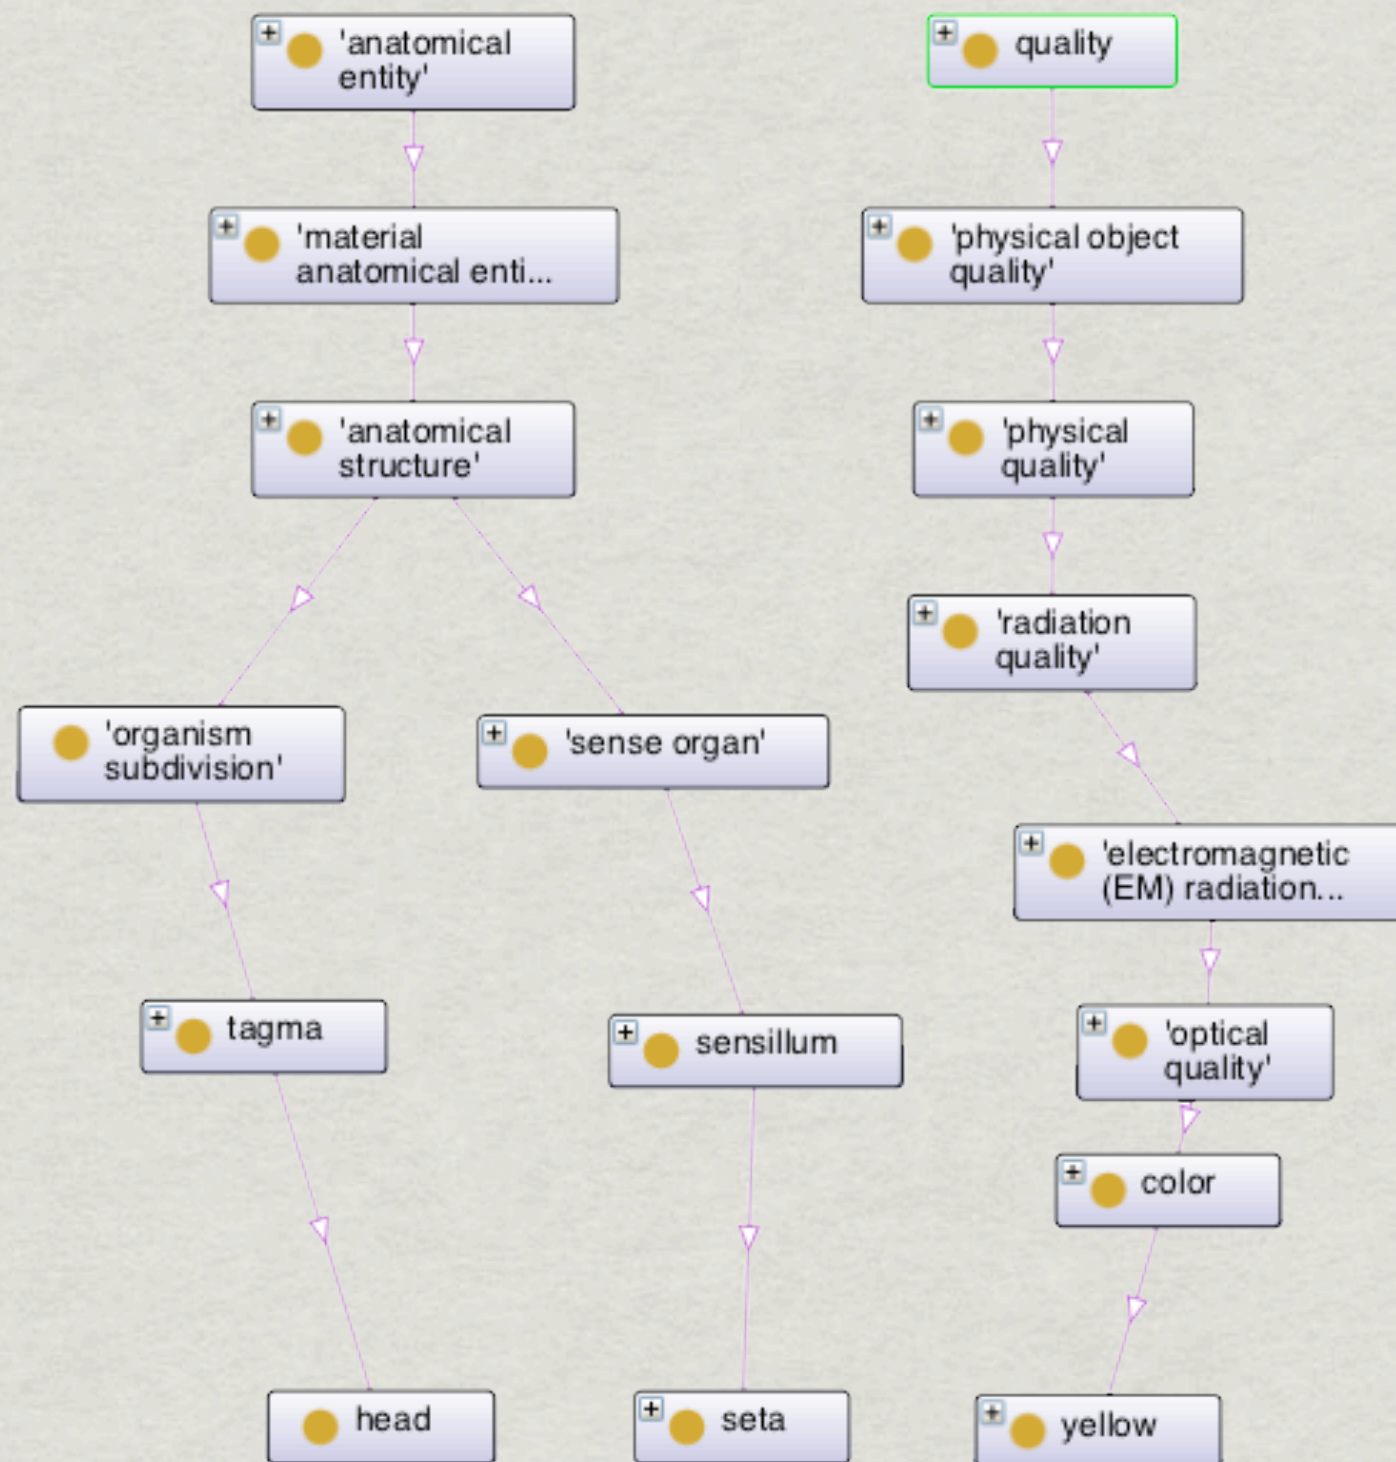

Phenote

Using annotations

- * Tagging/keyword — provide search for data using ontology hierarchy
- * “Yellow bristles apparent on head”
- * *PATO:yellow, HAO:seta, HAO:head*

- ✳ Can expand keyword query using hierarchy-aware middleware

Using annotations

“Yellow bristles apparent on head”

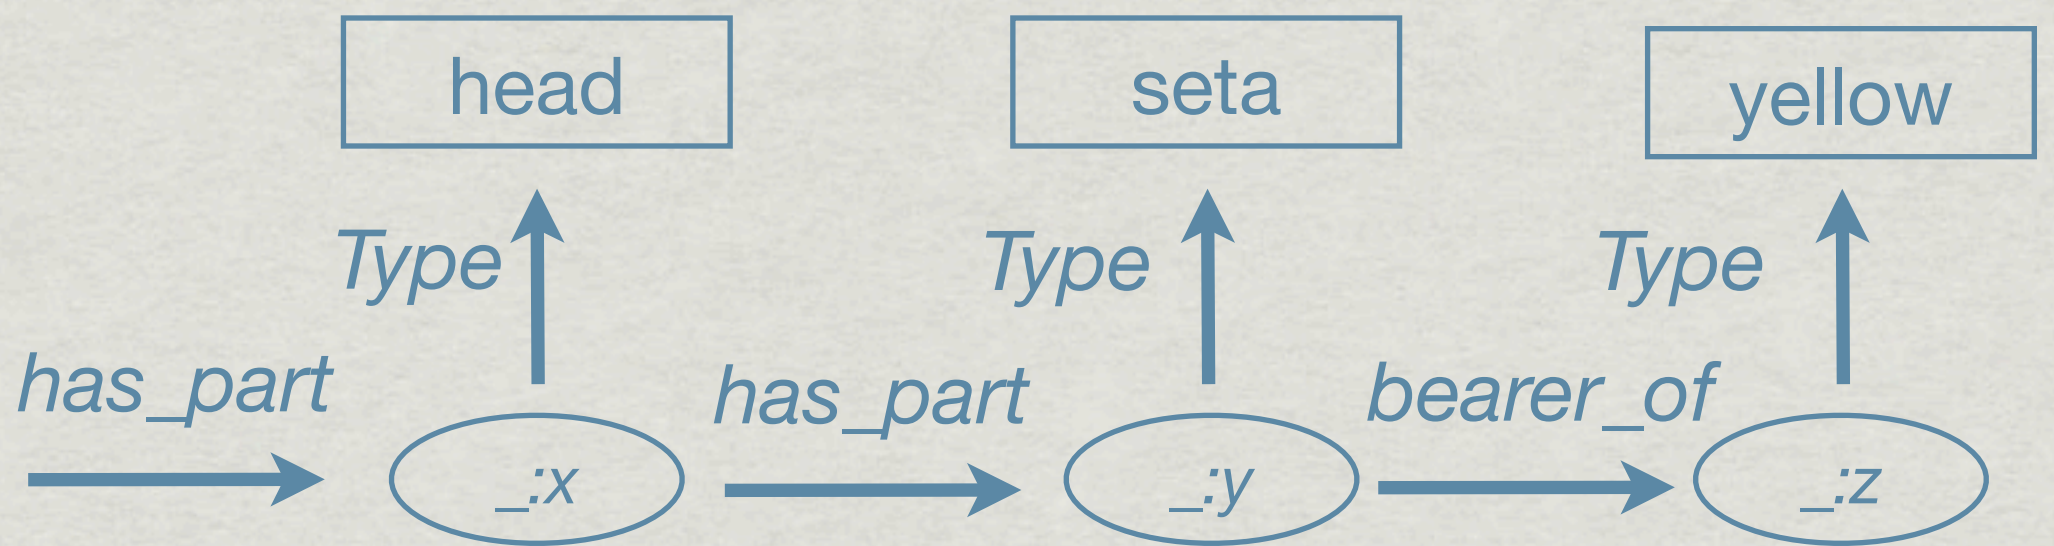

- * **E** and **Q** are not always sufficient
- * **Post-composition**: E = “bristle which is part of head”
- * **L?** — locator (“head”)
- * **RE**: Related/Dependent Entity — needed for some PATO qualities (“sensitivity toward”)

Using annotations

- * Knowledge representation
 - * Construct semantic model using EQ components
 - * “Extend” ontology
 - * Describe class of organisms or structures using a logical definition

Using annotations

- * “Yellow bristles apparent on head”
- * OWL class expression
 - * *has_part* some (**head** and *has_part* some (**seta** and *bearer_of* some **yellow**))

Using annotations

- * Can use semantic annotations in reasoner enabled environments
 - * OWL-API code, Protégé
 - * Reasoners: HermiT, FaCT++, Pellet, ELK
- * Phenoscape KB, Virtual Fly Brain

Protégé

adult subesophageal ganglion

Definition: Region of the adult brain beneath the esophagus, consisting of the fused gnathal segments.

Synonyms:

- * SOG
- * subesophageal ganglion

Parent classes:

- * subesophageal ganglion

Limitations

- * Difficult to adequately represent certain kinds of statements
 - * “antennae absent” ← (works but complicates reasoning)
 - * “antenna is longer than eye”
 - * “increased count of antennae”
- * Reasoning software does not scale well
- * *But, keep “tagging” utility in mind*
